

# SigmaCARE™

Pressure Redistributing Pillow

***Now you don't have to choose between infection control and pressure ulcer prevention.***

Research studies have found that between 12-45% of pressure ulcers emerge on the ears or

occipital region on patients in hospitals and nursing

homes. Most pillows used

in acute and long term

care are designed to be

disposable or washable

without regard to skin

integrity. CMS no longer

reimburses hospitals for

facility acquired pressure

ulcers so using the wrong

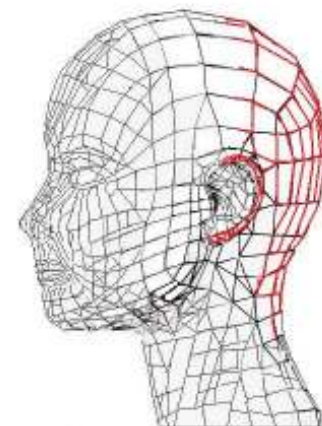

pillows could be costing

your facility money while placing your patients and

residents at higher risk of acquiring a pressure ulcer in this painful region. Sigmacare™

pillows are also great for elevating pressure ulcer prone areas such as heels and elbows.

Sigmacare™ pillows are available in standard and body pillow sizes.

Revolutionary SigmaFill™ and unique PolyStretch™ fabric ticking provide a softly conforming surface while also offering the safety of a fluid-proof antimicrobial polyurethane coating and flame retardant treatments. They may be cleaned regularly with a mild soap and water and can be disinfected using a diluted bleach solution.
